

Li+ Battery Charger with Thermal Regulation

Features

- Programmable Charge Current Up to 1A
- Charge Status Output Pins
- Soft-Start Limits Inrush Current
- 4.2V Charge Voltage with $\pm 1\%$ Accuracy
- Fixed 55mA Prequal Charge Current
- Thermal Limiting Simplifies Board Design
- External Thermistor Monitor
- Enable/Disable Control
- 3mm x 3mm DFN-10 Package (DFN3x3-10)
- Disable Charging When $V_{IN} > 6.4V$
- Lead Free Available (RoHS Compliant)

Simplified Application Circuit

General Description

The APL3201 is a constant-current/constant-voltage linear charger for single cell Li+ batteries.

The APL3201 needs no external MOSFET or diodes, and accepts input voltage up to 6.0V. The small packages and low external component count make the APL3201 ideally suited for portable applications.

On-chip thermal limiting simplifies PC board layout and allows optimum charging rate without the thermal limits imposed by worst-case battery and input voltage. When the APL3201 thermal limit is reached, the charger does not shut down but simply reduces charging current. Ambient or battery temperature can be monitored with an external thermistor. When the temperature is out of range, charging pauses.

Other features include the STAT1 and 2 outputs to indicate four charge states, and the EN input, switches the APL3201 on or off.

The APL3201 is available in 10-pin 3mmx3mm DFN-10 and MSOP-10 packages, and operates over the -40°C to +85°C temperature range.

Applications

- PDAs
- MP3 Players
- Cell Phones
- Wireless Appliances

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS and compatible with both SnPb and lead-free soldering operations. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J STD-020C for MSL classification at lead-free peak reflow temperature.

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

Pin Configuration

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{IN}	VIN to GND	-0.3 to 7	V
$V_{EN}, V_{BATT}, V_{THRM}$	EN, STAT1, STAT2, BATT, THRM to GND	-0.3 to 7	V
I_{CHG}	Charging Current	1.2	A
T_J	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature Range	-65 to 150	°C
T_L	Lead Temperature (Soldering, 10sec)	260	°C

Note 1 : Stresses beyond the absolute maximum rating may damage the device and exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics

Symbol	Parameter	Rating	Unit
θ_{JA}	DFN3x3-10 Junction to Air Thermal Resistance	50	°C/W

Note 2 : θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. The exposed pad of DFN-10 is soldered directly on the PCB.

Recommended Operating Conditions

Symbol	Parameter	Range	Unit
V_{IN}	VIN to GND	4.35 to 6.0	V
I_{CHG}	Charging Current	0.1 to 1	A
T_J	Junction Temperature	-40 to 125	°C
T_A	Ambient Temperature	-40 to 85	°C

Electrical Characteristics

Refer to the typical application circuit. These specifications apply over $V_{IN}=5V$, $V_{BATT}=4.2V$, $V_{THRM}=V_{REF}/2$, $T_J=-40\sim 125^\circ C$, $T_A=-40\sim 85^\circ C$, unless otherwise specified. Typical values are at $T_A=25^\circ C$.

Pin Descriptions

Pin		Function Descriptions
No.	Name	
1	VIN	Input Supply Pin. Provides power to the charger, V_{IN} can range from 4.35V to 6.0V and should be bypassed with at least a 4.7 μF capacitor.
2	STAT1	Charge Status Output Pin 1. This pin is an active-high, open-drain output pin.
3	ISET	Charging Current Setting Pin. Connecting a resistor from this pin to GND set the fast-charge current when the VIN is powering the charger.
4	GND	Ground.
5	EN	Charging Enable/Disable Control Pin. Drive EN high to begin charging, and EN low to stop charging.
6	THRM	External Thermistor Connection Pin. THRM pauses charging when an externally connected thermistor (10k Ω at +25 $^\circ\text{C}$) is at less than 0 $^\circ\text{C}$ or greater than +50 $^\circ\text{C}$. Connecting this pin to GND disables this function.
7	REF	3V Reference Voltage Output Pin. Sources up to 500 μA to bias the external thermistor. Bypass with 0.1 μF to GND. REF loading does not affect BATT regulation accuracy.
8	STAT2	Charge Status Output Pin 2. This pin is an active-high, open-drain output pin.
9	BYP	Bias Supply Pin for Internal Circuitry. Bypass with a 2.2 μF capacitor to GND.
10	BATT	Charger Output Pin. Connect this pin to the positive terminal of a Li+ battery.
-	EP	Exposed Pad. Connect a large ground plane for maximum package heat dissipation. Connect directly to GND under the IC.

Functional Descriptions

Precharge Current

When the APL3201 is powered with a battery connected, the IC first detects if the cell voltage is ready for full charge current. If the cell voltage is less than the prequal level (3V typ), the battery is precharged with a 55mA current until the cell reaches the proper level. The full charging current, as set by ISET pin, is then applied.

Charging Current Setting

The charge current is programmed by using a resistor from the ISET pin to ground. The battery charge current is 1000 times the current out of the ISET pin. The battery charge current is calculated by the following equation:

$$I_{CHG} = K_{SET} \times V_{SET} / R_{SET}$$

Where

V_{SET} is ISET regulation voltage (nominal=1V).

K_{SET} is the charging current set factor (nominal=1000).

The charging current set factor and the ISET regulation voltage are shown in the Electrical Characteristics. The ISET regulation voltage is reduced by thermal regulation function.

Enable (EN)

The enable input, EN, switches the charging of APL3201 on or off. With EN high, the APL3201 can begin charging. When EN is low, charging stops, REF is shutdown, and STAT1 and STAT2 outputs are off (high).

Battery Full Indication

Charge-done occurs when I_{CHG} falls to 12.5% of the current set by R_{SET} and the charger is in voltage mode (V_{BATT} near 4.2V). After the APL3201 enunciates the charge-done signal, it keeps operating in voltage mode without turning off the charger. The STAT1 is turned off (high) and STAT2 is turned on (low) when the charger is into charge-done state.

Thermal Regulation

On-chip thermal limiting in the APL3201 simplifies PC board layout and allows charging rates to be automatically optimized without constraints imposed by worst-case minimum battery voltage, maximum input voltage, and

maximum ambient temperature. When the APL3201 thermal limit is reached, the charger does not shut down but simply reduces charging current. This allows the board design to be optimized for compact size and typical thermal conditions. The APL3201 reduces charging current to keep its die temperature below +120°C. The APL3201's DFN3x3-10 package includes a bottom metal plate that reduces thermal resistance between the die and the PC board. The external pad should be soldered to a large ground plane. This helps dissipate power and keeps the die temperature below the thermal limit. The APL3201's thermal regulator is set for a +120°C die temperature.

External Thermistor Monitor (THRM)

The APL3201 features an internal window comparator to monitor battery pack temperature or ambient temperature with an external negative temperature coefficient thermistor. In typical systems, temperature is monitored to prevent charging at ambient temperature extremes (below 0°C or above +50°C). When the temperature moves outside these limits, charging is stopped. If the V_{THRM} returns to within its normal window, charging resumes. Connect THRM to GND when not using this feature. Note that the temperature monitor at THRM is entirely separate from the on-chip temperature limiting discussed in the Thermal Regulation section. The input thresholds for the THRM input are $0.74 \times V_{REF}$ for the COLD trip point and $0.29 \times V_{REF}$ for the HOT trip point.

Figure 1. Thermistor Sensing Block Diagram

Functional Descriptions (Cont.)

Charge Status Outputs

The open-drain STAT1 and STAT2 outputs indicate four charger operations as shown in Table 1. The two outputs can be used to drive LEDs or communicate to the host processor. Note that OFF indicates the open-drain transistor is turned off.

CHARGE STATE	STAT1	STAT2
Precharge in progress	ON	ON
Fast charge in progress	ON	OFF
Charge done	OFF	ON
Charge suspended	OFF	OFF

Table1. Status Pin Summary

Disable Charging for $V_{IN} > 6.4V$

When input voltage is over 6.4V overvoltage threshold, the charging of APL3201 will be turned off. The charging will be turned on until the input voltage is below the OVP threshold. The absolute maximum rating of input voltage is 7V, if the input voltage is over 7V the IC may be damaged.

Soft-Start

The APL3201 includes a soft-start function to control the rise rate of the charging current rising from zero to the fast-charging current level in constant current mode. During charger soft-start, the APL3201 ramps up the voltage on ISET pin with constant well-controlled slew rate. The charging current is proportional to the ISET voltage. The soft-start interval is 7 ms (typical), which is independent of the fast-charging current level.

Figure 2. Typical Charging Profile

Application Information

STAT Pins

The STAT1 and STAT2 outputs indicate four charger operations. These two pins can be used to drive LEDs or communicate to the host processor. When status pins are monitored by a processor, there should be a 10kΩ pull-up resistor to connect each status pin and the V_{CC} of the processor; furthermore, when the status is viewed by LED, the LED with a current rating less than 10mA and a resistor should be selected to connect LED in series, so that the current will be limited to the desired current value. The resistor is calculated by following equation:

$$R_{LED} = \frac{(V_{IN} - V_{LED_ON})}{P_D}$$

In other words, the LED and resistor between the input and each status pin should be in series.

Capacitor Selection

Typically, a 4.7μF ceramic capacitor is used to connect from VIN to GND. For high charging current, it is recommended to use a larger input bypass capacitance to reduce supply noise. There is a ceramic capacitor connecting from BATT to GND for proper stability. To work well with most application, at least a 2.2μF X5R ceramic capacitor is required.

Thermal Considerations

The APL3201 is available in a thermally enhanced QFN package with an exposed pad. It is recommended to connect the exposed pad to a large copper ground plane on the backside of the circuit board through several thermal vias for heatsinking. The exposed pad transfers heat away from the device, allowing the APL3201 to charge the battery with maximum current, while minimizing the increase in die temperature.

The most common measure of package thermal performance is thermal resistance measured from the device junction to the air surrounding the package surface (θ_{JA}).

The θ_{JA} can be calculated by the following equation:

$$\theta_{JA} = \frac{T_J - T_A}{P_D}$$

where:

T_J =device junction temperature

T_A = ambient temperature

P_D =device power dissipation

The device power dissipation, P_D , is a function of the charge rate and the voltage drop across the internal FET. It can be calculated by the following equation:

$$P_D = (V_{IN} - V_{BATT}) \times I_{CHG}$$

PCB Layout Considerations

The APL3201 is packaged in a thermally enhanced QFN package. The package includes a thermal pad to provide an effective thermal contact between the device and the printed circuit board. Connecting the exposed pad to a large copper ground plane on the backside of the circuit board through several thermal vias for heatsinking is recommended. Connecting the battery to BATT as close to the device as possible provides accurate battery voltage sensing. All decoupling capacitors and filter capacitors should be placed as close as possible to the device. The high-current charge path into VIN and from the BATT pin must be short and wide to minimize voltage drops.
